

# V-MAX

## Installation:

1. Be sure to clean the surface of automotive body panels by washing thoroughly with warm, soapy water to remove any dirt or dust particles. CAE recommends cleaning the surface once more with an ammonia based, aerosol glass cleaner to remove unwanted wax and grease.
2. Cut the **VMAX** damping square to fit the panel to be treated. The material can be cut with scissors. Remove the release liner and apply to the prepared surface. Apply pressure to damping sheet with fingers to ensure good contact to substrate. For larger surfaces, pull release liner down about 6 inches and apply to surface. Keep working the material down the panel in 6 to 8 inch increments until full adhesion has been achieved.
3. Remove any trapped air by making a small incision with an X-Acto knife or Pick tool on one side of the bubble. Push the bubble towards the cut, purging any trapped air. This method is best done when the material is cool to the touch.
4. 50% coverage will yield good damping, however 75% to 100% coverage will maximize the effects of the product.

### **TOOLS:**

- Your fingers
- Scissors or a razor knife
- Pick tool to eliminate trapped air bubbles
